WINTER 2021**

## BRAKEWORKS REMANUFACTURING PRINCIPLES

Remanufacturing is the process of returning used calipers to original or better performance specifications, as well as giving the caliper an OEM quality warranty.

The remanufacturing process consists of reusing the principle components. Each caliper is dismantled by hand and each part is inspected for wear and deterioration. After the parts are cleaned and examined, they are then separated by what can be reused and what cannot, or will not, be reused. Any parts that are broken, missing, damaged, or otherwise unsafe to reuse, will be replaced by a new OEM quality part. All used parts will be machined or refinished to restore to "like-new" working condition.

The remanufacturing process, similar to the recycling process, is much more environmentally friendly. This process in no way decreases the reliability or safety of the finished product. The main body is inspected for cracks, breakages, distortions, etc. After the inspection the body is degreased and cleaned in a hot pressure detergent bath. The caliper is then shot blasted to smooth out any imperfections.

The internals of the caliper are thoroughly inspected. Bearings, rubber parts and the majority of smaller working parts are replaced in each remanufactured caliper. Once the caliper is re-assembled the product is bench tested to ensure correct functionality and alignment. The final part of the remanufacturing process is to date stamp each caliper to ensure complete traceability.

In September 2016, the top six international remanufacturing associations met in Frankfurt, Germany, to determine the world-wide definition for remanufacturing. Below you will find the definitions created by these associations, and apply to BrakeWorks remanufactured calipers.

**Remanufacturing Process:** Remanufacturing is a standardized industrial process\* by which cores are returned to same-as-new, or better, condition and performance. The process is in line with specific technical specifications, including engineering, quality and testing standards. The process yields fully warranted products.

\*An industrial process is an established process, which is fully documented, and capable to fulfill the requirements established by the remanufacturer.

**Core:** A core is a previously sold, worn or non-functional product or part, intended for the remanufacturing process. During reverse logistics, a core is protected, handled and identified for remanufacturing to avoid damage and to preserve its value. A core is not waste or scrap and is not intended to be reused before remanufacturing.

**Remanufactured Part:** A remanufactured part fulfills a function which is at least equivalent compared to the original part. It is restored from an existing part (CORE), using standardized industrial processes in line with specific technical specifications. A remanufactured part is given the same warranty as a new part and it clearly identifies the part as a remanufactured part and states the remanufacturer.

## BENDIX & KNORR-BREMSE ADB22X

\*Photo of caliper above shows long pin on the left side, OEM casting #Z035248. Reverse caliper will have the long pin on the right side, OEM casting #Z035247. Generally the long pin on the left side will be a left side caliper. **Trailer calipers excepted. Due to 0° chamber mount, trailer calipers are interchangeable.**

**The use of competitor names is for reference purposes only and is not meant to imply that BrakeWorks has ownership or affiliation with any of those manufacturers.**
